

# UniBroker

## PCI Compliance Solution

UniBroker is a traffic broker designed to filter out sensitive data, such as account holders information, from the data streams exchanged between UniPay and its client. It is deployed as a kind of proxy server between UniPay and any other applications communicate with it.

UniBroker is engineered to support real-time and batch data encryption and is capable of replacing sensitive data with encrypted/tokenized equivalent as it flows through the system.

UniBroker removes all other UniPay modules from the scope of a PCI audit

UniBroker itself is written in a very compact and straight forward way, which reduces to the bare minimum the time necessary for the system audit.

### The key features of UniBroker are:

#### Data Filtering

- Configurable Filtering for Formatted Data Streams (XML, CSV, etc)
- Restful Web Service API for Real-Time Data
- Tokenization
- Real-Time and Batch Extraction and Tokenization of the Sensitive Data

#### Communications Handling

- HTTPS and SFTP Communication
- API for integration with external tokenization appliances and services
- PGP encryption and GZip support
- Secure key and password management
